

# Annex 5 Lighting/Signalling – Lamp Apparent Surface 9.1

For the purpose of this test the “Apparent Surface” of the lamp is the light emitting surface of the lamp that would be visible from the given angles of observation if there was no obstruction from other vehicle components (ie. visualising the lamp alone in the same orientation as it is mounted on the vehicle).

The light emitting surface should be taken to be the outer surface of the lens cover, being the lens onto which the light is projected directly from the bulb/reflector, and being the surface which together with the bulb provides the appropriate lamp colour.

**NOTE:** Material that provides an **additional** cover to the light emitting surface should be disregarded unless

- the light is projected directly from the bulb/reflector onto it
- it provides light defusing properties, or
- it provides the appropriate lamp colour.
